

Agents run on *your data*

An AI agent works from whatever data is already in your systems. With clean, consistent data its answers are good. With duplicated, incomplete or stale data its answers are wrong, and they **read just as well**. Nothing in the agent fixes the data underneath, and it works at machine speed.

THE 3 CHECKS BEFORE YOU DEPLOY AN AGENT identity · completeness · source of truth

- I

Identity
"Can you reliably tell when two records are the same entity?"
- If not, every ranking double-counts, fragments the history, and distorts priority.
- 2

Completeness
"Are the specific fields the agent reads actually populated?"
- If a field is blank, the agent still answers, from whatever it has.
- 3

Source of truth
"When ERP, CRM and support disagree, is there one answer?"
- If not, the agent ends up using one of them, and once people catch it using the wrong one, they stop trusting it.

WHAT THE AGENT ACTUALLY SEES one account · three records

Same company, three records, plus industry blank on 40% of accounts and stale activity dates. The agent can't tell they're one company, so it **ranks the account wrong** and writes a full paragraph explaining the wrong ranking.

Why it fails **quietly**: bad data used to show up as an empty dashboard or a failed join. With an agent there is no warning, just a well-written answer that is wrong. And people can't quietly patch it the way they do today, when the reps know which "Vihren Labs" record is the right one and Finance keeps a reconciliation sheet. **The agent reads the data exactly as it is.**

Monday morning YOUR FIRST MOVE

Before you shortlist a single agent, pick the **one entity** any AI decision would touch first – customer, supplier, product, or contract – and **pull the duplicates**. Count how many times your highest-value entity exists more than once, and check whether the fields an agent would read are populated.

Do that count before any vendor demo. Self-check: would you trust your own data enough to let a machine decide from it, continuously and in real time?

OPERATOR INSIGHT · LAYER 2

AI doesn't create truth; it amplifies the truth your systems already contain.

"Your AI maturity will never exceed your operational maturity."
